## Countdown News to 17<sup>th</sup>-19<sup>th</sup> Nov Storms (issued 11<sup>th</sup> Nov) Gales & heavy rain Britain & Ireland confirm 11-12/13<sup>th</sup> Nov forecast. **Major Storm 17<sup>th</sup>-19<sup>th</sup> Nov still very likely.**

The wind and rain entering Ireland & Britain on 11<sup>th</sup> Nov and expected to continue through 12<sup>th</sup>/13<sup>th</sup> confirms WeatherAction's long range November forecast for the detailed period 11-13 Nov

Full forecast via: <http://www.weatheraction.com/member.asp>

Piers Corbyn, astrophysicist of WeatherAction said: "Our November forecast detail has been going very well so **our confidence for a major storm to cross Britain & Ireland and head into Scandinavia in the period 17<sup>th</sup>-19<sup>th</sup> Nov remains 85%.**

"As our forecast – first created 100 days ahead – spells out, the powerful Low expected is likely to cause a North Sea Storm Surge and associated **coastal flood risks**. All our forecasts are of course subject to *uncertainty – see detail* – so there is, as it stands now, still 15% chance that the Low will not be powerful enough, or have an appropriate track to cause the scenario which we first predicted for this important SWIP (Solar Weather Impact Period). Dates are normally accurate to 1 day.

**"Importantly for this period our Solar Weather Technique Weather Action Indicators mean that events are likely to take standard meteorology by surprise even from less than 3 days ahead.**

"We predicted the active period 11-13<sup>th</sup> would be followed by weather which would turn quieter during 14<sup>th</sup>-16<sup>th</sup> which could confuse expectations before the Major 'TOP level' SWIP of around 17-19<sup>th</sup> Nov strikes.

**"In world weather terms 17-19 Nov is a very significant SWIP** which will see (near) simultaneous major extreme events worldwide in the same ~3 day period affecting many countries and every continent. Some of these events are explicitly predicted by SWT25d but there will be others which are in principle predictable but not now predicted and which will become such with further work.

"In view of the Copenhagen Climate Summit it is important to note that these extreme events forecasts are driven by predictable particle and magnetic activity from the sun and CO2/ 'Global Warming' plays no part whatsoever in the incidence of extreme weather events (see WANews80 <http://www.weatheraction.com/displayarticle.asp?a=103&c=1>). "
