## Countdown News to 17<sup>th</sup>-19<sup>th</sup> Nov Storms No3 (issued 16<sup>th</sup> Nov)

### The Unfolding storms and what to expect for Britain, Ireland, Scandinavia and around the world.

- **South/West coasts Brit & Ireland also under threat.**
- **N Sea coastal flood risk remains 50/50**
- **Simultaneous storm events predicted across world**
  - USA, East Pacific, Philippines / S China Sea, N Indian Ocean / Sri Lanka, NE Australia (Coral Sea / Queensland)

Piers Corbyn, astrophysicist of WeatherAction gives the latest developments around the WeatherAction **Red Weather Warnings** driven by WeatherAction's **Solar Weather Impact Periods (SWIPs) of 11-13 Nov & 17-19 Nov** (dates to within a day from about 100 days ahead and re-confirmed mid Oct)

WeatherAction **key extreme event forecast statements** - and comments so far - in double-storm periods 11-13 Nov ('prelude') & 17-19 Nov; as in issued forecasts:

- *for* **damaging winds**; deluges; **thunder/tornado risk**; and **coastal flood risk** in Ireland, Britain & Scandinavia & Benelux (espec Holland) .
- *and* specific forecasted **extreme events around the world** 17<sup>th</sup>-19<sup>th</sup> Nov

### For 11-13<sup>th</sup> Nov SWIP & Red Warning with

**Mod/high thunder/tornado risk**

**Top Gusts (Brit/Ire) 50-80mph**

Likely possible weather map scenario:  
High pressure to S. Waves of frontal activity are likely coming from the W/NW associated with low centred N Norway sea / North Scandinavia. Fronts pass through Britain & NI & into Scandinavia.

The extra thunder/tornado risk was *confirmed* with **thunderstorms in the period and a tornado in Benfleet**

**Essex** on the morning of 14<sup>th</sup> - 60 homes were damaged -

<http://news.bbc.co.uk/1/hi/england/essex/8360298.stm> [http://news.bbc.co.uk/weather/hi/uk\\_reviews/newsid\\_8361000/8361301.stm](http://news.bbc.co.uk/weather/hi/uk_reviews/newsid_8361000/8361301.stm)

**Top gusts in region of 50-80mph on land were confirmed** - above link &

[http://news.bbc.co.uk/weather/hi/uk\\_reviews/newsid\\_8358000/8358625.stm](http://news.bbc.co.uk/weather/hi/uk_reviews/newsid_8358000/8358625.stm) ;

[http://news.bbc.co.uk/weather/hi/uk\\_reviews/newsid\\_8360000/8360423.stm](http://news.bbc.co.uk/weather/hi/uk_reviews/newsid_8360000/8360423.stm) ; <http://news.bbc.co.uk/1/hi/wales/8360168.stm> , &

<http://news.bbc.co.uk/1/hi/uk/8360106.stm> which also reports **100mph winds at sea - the Needles Isle Of Wight.**

Piers commented, "We are very pleased with the 11-13<sup>th</sup> results. The likely possible weathermap scenario was also reasonably confirmed although there was more activity in South Britain. This however gives us more confidence that extremes around 17<sup>th</sup>-19<sup>th</sup> in Ire/Britain, Europe & the world will develop beyond the expectations of standard meteorology.

**"We expect Standard Met forecasts issued from the 16<sup>th</sup> to change more towards the SWT scenario.**

"The forecasted quieter interlude around 14-16<sup>th</sup> has been somewhat quieter than 11-13<sup>th</sup> but has got squeezed at both ends which again confirms our general prediction of major SWIP effects in this general period 11-19<sup>th</sup> Nov"

**Full detailed Brit & Ire forecasts** for these periods and all November including top winds *and for Extreme events around the world*: <http://www.weatheraction.com/member.asp> . Interested people should realize that WeatherAction receives no state support and research and forecast production is funded by forecast sales so we make no apology in urging people to subscribe or donate via this link.

# For 17-19<sup>th</sup> (to within a day) Major TOP SWIP and Red Warning with

**Top Thunder/Tornado Risk**

**Sev gales inland, Force 10 to 12 at Sea (gusts 75mph to 100mph)**

**'Stormy with heavy rain' - N Sea Storm &**

**N sea storm SURGE = Coastal flood warnings East Anglia & Holland**

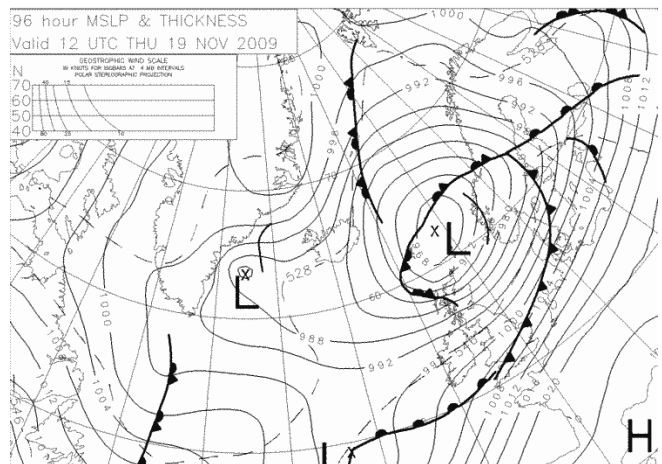

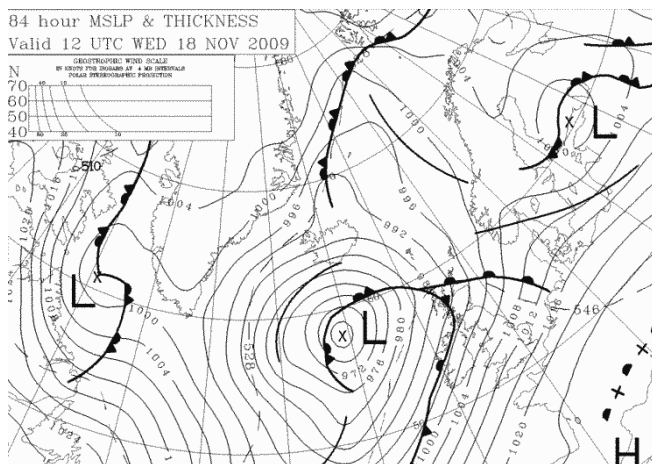

Likely possible weather map scenario:

Atlantic ridge, powerful deep 'dartboard' low moving E centred N of Scot going into Scand

**Uncertainty: Low could be further Nth so fetch of strong winds in N sea insufficient for danger of 'overtopping' of sea defences.**

Piers says "As it stands Standard Short range forecast maps show strong evidence (90% at this stage) that the thunder at least, Sev gales inland and A dartboard low and a storm in the N Sea will be confirmed (see maps below) the question of a N'yly storm surge and consequent coastal flood risk in East Anglia and Holland is still open and on coastal floods risk there are two important points:

- (i) The severity of the (South-)Westerly winds on these MO maps and the extra Solar Factor enhancement the SWT confidently expects in the SWIP 17-19<sup>th</sup> means **that there are now likely threats to vulnerable Southern & Western coasts (as well) in regions shown on BBC map of general coastal flood risk: <http://climaterrealists.com/?id=4366> and to North Holland / Danish NW German coasts. NB. Wind effects will be enhanced by New Moon 16<sup>th</sup> extra tidal effect.**
- (ii) The 96hr ahead MO map for 19<sup>th</sup> is consistent with our long range forecast and if the centre of the low heads into Norway in line with our expectation N'yly gales will follow with an associated North Sea Storm surge and coastal flood risk/Warnings in East England and Holland. At this moment that scenario remains (from SWT view) more likely than not; and as stated at the conference in Imperial College Oct 28<sup>th</sup> in the presence of BBC **the possibility of some actual consequent coastal flooding remains at 50/50:** video <http://www.kane-tv.com/wa/piers3.html>

## Extreme Events around the world in period around 17<sup>th</sup>-19<sup>th</sup> Nov 2009

For 17<sup>th</sup>-19<sup>th</sup> our Weather Action Indicators mean that events are likely to take standard meteorology by surprise all over the world even from less than 3 days ahead. **In world terms 17-19<sup>th</sup> Nov is a very significant SWIP which will see many (near) simultaneous major extreme events worldwide in the same ~3 day period affecting many countries & every continent.**

The specific forecasted extreme events under SWT25d for around 17<sup>th</sup>-19<sup>th</sup> Nov are:

- **USA** Enhanced Tornado thunder (& blizzard or flood risk in the right circumstances)
- **East Tropical Pacific** Storm formation likely: Most likely off Mexico New storm TS or H1 prob heading out further into Pacific. Confidence 80%. Prob of landfall hit <10%

- **West Pacific Tropical storm / Typhoon formation**: One or two storms forming in South China Sea &/or East of Philippines. Reaching level T1-3. **Philippines & South China / Vietnam subsequent land hits likely (80%)**.
- **One late season N Indian Ocean TC** prob to East of Sri Lanka with **Sri Lanka hit likely**.
- **One early season TC forming off NE Australia** in Coral Sea / S Pacific East of Brisbane, tracking NW. No landfall but effect on Queensland.

It is up to users to assess our forecasts but for guidance the 11 boxed statements above are all the explicit high confidence forecast statements of storm developments we issued for the prelude (11-13) and main (17-19) periods (timing within one day).

## And What about CO2 & ‘Global Warming’ ?

“In view of the **Copenhagen Climate Summit** and related climate and weather scare stories it is important to note that these extreme events forecasts are driven by predictable particle and magnetic activity from the sun. **CO2/ Global Warming religion plays no part whatsoever in the incidence of extreme weather events and CO2 centered models of climate change have demonstrated zero or negative forecasting ability** (see WANews80 <http://www.weatheraction.com/displayarticle.asp?a=103&c=1>)”
