- **Absurdity of Global warmers hype attacked**

Evidence-based science must come before ideology. The Copenhagen Climate hysteria jamboree must be opposed and no deal agreed.

Piers Corbyn, astrophysicist of WeatherAction.com long range forecasters reported on the dramatic weather events which confirmed his forecasted ‘TOP’ Solar Weather Impact Period 17<sup>th</sup>-19<sup>th</sup> Nov: **“We are very pleased with the outcome of the forecast but our thoughts go to those suffering material and tragic personal loss and we must ask could this be avoided?”**

- **“The severity and timing** of extreme events over Britain, Ireland, NW Europe and the world was excellent.
- **“Standard Meteorology consistently underestimated the severity of events even 12 hours ahead *as we warned they would.* This has caused unnecessary suffering and loss.**
- **“A lot of our detailed forecast statements were confirmed but the 50/50 possibility of storm-surge tidal floods in the N Sea did *not* happen. The reason is also why Cumbria was devastated by floods;** and appears connected to why *some* other events around the world stopped or developed differently from expected. /next page

## Stuck deluging fronts

“The important thing about the 17<sup>th</sup>-19<sup>th</sup> was firstly that the TOP SWIP happened around the world.

In the N Atlantic / NW Europe the storm developments on the 18<sup>th</sup> were in line with our detailed long-range expectations including (briefly) increasing high pressure North of Iceland and an active low (982) diving into South Scandinavia on our preferred track. (see Observation map). If the deep low (956) had followed a similar track a N/NW storm force wind in the N Sea would have followed and given a major North Sea storm surge. As it was there was a storm force 11\*\* from the NW briefly due to the 982 but the deep **low 956 did not follow and stayed stuck** where it was giving

the stationary fronts over Cumbria & N Britain which caused the 12 inches of rain over 3 days. **So instead of the TOP SWIP giving coastal floods in East Anglia driven by a N Sea flood tide surge we had devastating floods in Cumbria.** [See also <http://climaterrealists.com/attachments/database/Piers%20Email%20North%20Sea%20Storm%20Surge.pdf> ]

\*\* Fisher: Gale warnings - Issued: 0347 Wed 18 Nov - Southwesterly gale force 8 increasing storm force 10 then veering **northwesterly violent storm force 11** soon.

## The World-wide impact of SWIPs

Amazingly – but comprehensibly in terms of the Solar Weather Technique – some of the extreme events also predicted by the SWT around the world became curtailed **at the same time as ‘Low 956’ got stuck**. Although dangerous storm general developments in the USA took place as expected, there was no East Pacific late storm and the West Pacific development faltered (see below). Even more amazingly there was no forecasted Tropical Cyclone near Sri Lanka (see WANews No87) but **there were astounding deluges and devastating floods IN THE SAME PLACE from a less organized storm** which had not hit the cyclone grade. The floods made 58,000 homeless. Presumably these were from slow moving ‘stuck’ deluge-bearing fronts like over Cumbria.

The simultaneity of world weather extreme events is incomprehensible to standard meteorology and CO2 - Global Warming religion, but such things follow directly from the simultaneous world-wide external Solar-Lunar forcing factors predicted by the SWT. We know the TOP SWIP of 17<sup>th</sup>-19<sup>th</sup> was driven by predictable solar activity and modulated by lunar effects and it seems the specific details (probably operating in upper levels) - the science of which we are developing - changed some expected events around the world giving slower-moving fronts - but of equally devastating consequence.

“TOP SWIPS of the strength of this one on 17-19 Nov are rare. There might normally only be one or two a year and they always lead to major storm or flood events. **However there is another TOP SWIP of comparable strength at the end of December** (details via <http://www.weatheraction.com/member.asp> ).

## Met Office consistently underestimated severity of events despite WeatherAction Warnings of TOP SWIP

“Throughout the period 17th-19th The Met Office & Environment Agency consistently underestimated the severity of events – **as we warned they would** – and even on 19<sup>th</sup> they were stating things wouldn’t get much worse yet **devastation followed** in Cumbria. Had they paid attention to our warnings they wouldn’t have given people such a false sense of security.

Gordon Brown & Hilary Benn did an excellent job in acting to ensure the emergency services got proper support but Hilary Benn’s subsequent remarks (backed by the usual BBC propaganda) that “*This is a one in a thousand year event and the scientists are saying that there will be more floods* (and extreme weather - due to man-made CO2 / Climate Change / Global Warming)” are foolish, irresponsible and undermine his credibility. He should note:

- (i) This RED WEATHER WARNING Period was predicted by the SWT 100 days ahead.
- (ii) These type of flood events and very wet seasons are predictable and occur in predictable waves of a few years typically every 133 yrs (see below\*\*\*).
- (iii) There is no basis in evidence for his ‘*Cumbria was a one in 1000 year event but there are more to come*’ alarmist innuendo. For quite a few residents it was the worst since 1966 not 1066. **He should name the scientists who make these claims and cite the evidence for CO2 driven warming and extreme events.** ***There is no such evidence.*** He also needs to be aware that **very serious questions have been raised** about the processing and modification of frequently quoted official temperature data- <http://climaterrealists.com/index.php?id=4398&linkbox=true>
- (iv) If Hilary Benn MP and Michael Jack MP, Chair of the House of Commons Environment & Rural Affairs select committee, care about the welfare of the public they should put evidence-based science before ideology and stop manipulating people’s suffering under natural events into alarmist nonsense to promote CO2 taxation and Green scams. We can advise them on the possible dangers to UK tax-payers of the next TOP SWIP if they wish.

**\*\*\* Natural periodicity of natural events.** There was a series of very wet UK summers/years in 1875, 1876, 1877 and 1879 which is approx 133 years prior to the current series, 2007, 2008, 2009 (and...beware it is not exact clockwork!) and as Piers Corbyn pointed out and warned at the Imperial College Union's Centenary Presidents dinner in July 2007 this time is  $7 \times 19 = 133 = 6 \times 22.2$  (approx) where 19 years is the main eclipse cycle of the moon & sun and 22.2 years (approx) is the magnetic cycle of the sun. "Similar Earth – solar magnetic – Lunar states give similar types of weather regime" he explains.

## And What about CO2 & 'Global Warming' ?

"In view of the **Copenhagen Climate Summit** and related climate and weather scare stories it is important to note that these extreme events forecasts are driven by predictable particle and magnetic activity from the sun. **CO2/ Global Warming religion plays no part whatsoever in the incidence of extreme weather events and CO2 centered models of climate change have demonstrated zero or negative forecasting ability** (see WANews80 <http://www.weatheraction.com/displayarticle.asp?a=103&c=1>)"

**More detail of 17<sup>th</sup>-19<sup>th</sup> Brit & Ire:** "We have received many congratulations from near and far for the 17<sup>th</sup>-19<sup>th</sup> forecasts (eg see links) and we thank all those who follow us. We have heard much less from "GW" bloggers who normally reserve their 'assessment' of our forecasts to when we go wrong or for the detail rather than the big picture. It is still bizarre how they compare the detail of our ONE forecast made often 100days ahead with standard Meteorology's normally 5<sup>th</sup> version made 12 hours ahead of events. The point is our detail is what seems the most likely from a long time ahead in a general picture of which we are normally highly confident. Nearer the events standard meteorology should pay attention to what we say in order to improve forecasts and reduce suffering. In this instance we made 'end-game' pronouncements that the main storm surge danger would move to Western coasts - which it did and that standard meteorology would continue to underestimate severity of events - which it did.

In terms of the **detail** for the double hit storms extended period in Brit, Ire & North Sea:

**11-13<sup>th</sup> (prelude)** – Well confirmed (see WANewsNo87 - <http://www.weatheraction.com/displayarticle.asp?a=110&c=1>) although more activity in South B&I.

### 17-19<sup>th</sup> TOP SWIP

- **Stormy with heavy rain** – Yes
- Atlantic ridge & consequential major N wind & Blizzards in Scotland later - No
- N Sea storm & Coastal flood warnings East Anglia & Holland – No for East Anglia; Yes for Westerly driven attacks to coasts of Denmark N Germany & **North Holland**.
- S Ireland & S/W England less wet & windy (than North) – Yes
- Deep **dartboard** Low moving East – Yes (although East motion reduced)
- **Sev gale** inland (eg N Wales etc) – Yes
- **Storm Force** 10 to Hurr 12 at sea – Yes storm 11 in Fisher North sea near Copenhagen

### Developing Typhoon in West Pacific that stopped 19 Nov

034 abpw10 pgtw 190600 msgid/genadmin/navmarfcstcen Pearl Harbor hi/jtwc//subj/significant tropical weather advisory for the western and/South Pacific oceans/190600z-200600zno2009//rmks/ 1. Western North Pacific area (180 to Malay Peninsula): a. Tropical cyclone summary: none.  
B. Tropical disturbance summary: (1) the area of convection previously located near 5.1n 152.8e has dissipated and is no longer considered suspect for development of a significant tropical cyclone in the next 24 hours.  
(2) the area of convection previously located near 6.4n 174.9e is now located near 8.1n 171.5e, approximately 230 nm east of kwajalein. Animated multispectral satellite imagery depicts a developing low-level circulation center (LLCC) with isolated bursts of deep convection over the center. A 190242z AMSU image supported a weak LLCC with very weak convective banding over the northeast quadrant. The CIMSS 850 mb vorticity product also indicates a very small, weak vorticity signature. Surface observations from Majuro and kwajalein indicate 10-knot winds with slp near 1006 mb. Overall, the LLCC is located within a marginal environment characterized by moderate vertical wind shear and diffluent easterly upper-level flow. Animated water vapor imagery does depict enhanced poleward outflow associated with an upper low near 25n 170e. Maximum sustained surface winds are estimated at 12 to 18 knots. Minimum sea level pressure is estimated to be near 1005 mb. Based on the developing LLCC evident in satellite imagery and the enhanced poleward outflow channel, **the potential for the development of a significant tropical cyclone within the next 24 hours remains fair.**
