## 24 June 09:00 hrs UT = 04:00 EDT

Piers Corbyn of WeatherAction.com issues likely END GAME improvement on track and strength development of Caribbean storm active area that could be headed for Gulf.

“Invest 93 is likely to power-up in the period Sat 26<sup>th</sup> to Monday 29<sup>th</sup> above standard forecast expectations at this moment (24<sup>th</sup> June 09:00 UT = 04:00 EDT) and veer to the right (East) as it does so. This implies the likely track (Yellow thick line) will initially be roughly along the blue curve in the standard projections below and then veer towards the purple curve as it powers up and passes through the Yucatan Channel, crosses the purple curve and heads for Florida where landfall is likely to the EAST of all current standard projections.

This forecast statement has a 70% confidence of reasonable success”
