

# Record Floods New York & blizzards New Zealand support Solar-Lunar theory.

- Approx 60 year Solar-Lunar cycle of extreme events again confirmed.
- N & NE USA floods and cool-down USA predicted in long-range by Piers Corbyn's Solar-Lunar Action Technique
- "CO2 Warmist dogma is now dead"

The dramatic blizzards and extreme cold thrashing New Zealand and the floods in N / NE USA in particular New York around 13-15 August are nothing to do with so-called man-made Climate Change but are types of extreme events which have happened before and are driven by solar-lunar controlled predictable circulation patterns which also occurred roughly 58-60 years ago as explained by Piers Corbyn's Solar Lunar Action Technique (SLAT) of long range weather forecasting; see VIDEO with equations! <http://bit.ly/j5LG6e>

Piers Corbyn's WeatherAction also explicitly predicted, to the day, USA severe thunderstorms / tornadoes & strong winds <http://bit.ly/qJwMIIm> , <http://bit.ly/ovwxAc> and FLOODS around 13-14<sup>th</sup> Aug see (right <http://twitpic.com/6558mj> ) followed by general cool-down (eg <http://www.hpc.ncep.noaa.gov/basicwx/day0-7loop.html> ).

Coronal Holes streaming fast material to the Earth around Aug14/15 <http://bit.ly/o1WOLQ> , preceded by major rapid magnetic changes near Earth <http://bit.ly/MPq0o>

The New Zealand major polar blast <http://bit.ly/nMSnJB> - VID <http://bit.ly/oLbnMe> with blizzards, 8 metre swell & tornado! - situation was matched 50-70 yrs ago by similar extremes – see Comment <http://t.co/nqaZfah>

The New York Floods <http://nydn.us/qqWROd> & months of accumulated rain fit a pattern of April to July (NB Aug2011 data unavailable) rainfall where the three largest peaks in smoothed-out rain relative to trend line are around 2011, 1948 & 1901; graph right - <http://1.usa.gov/nGOHxB> . Of course there are lesser peaks but these are, relative to 2011, 63 yrs ago and 110 = 2 x 55yrs ago. These results support the SLAT theoretical average ~58-60yr general repeat of extremes [NOTE this is NOT about repeats of events but of prevalence of circulation types. There are other ways of estimating but this calculation shows ~58-60 yrs is a reasonable possibility.]
