

Storms & quakes confirm top Red warning ~Jan 11-13 (Report 1)

- Solar coronal action and quakes suggest 11-13th top ('R5') WeatherAction Red warning period coming one day early.
- Standard Meteorology changing 1 & 2 day ahead forecasts towards WeatherAction 12 weeks ahead forecast.

Storm events USA & UK which were specifically forecast by WeatherAction in long range and new major earthquakes around trial dates predicted are confirming WeatherAction's top level ('R5') Red warning ~11-13 Jan (one day uncertainty).

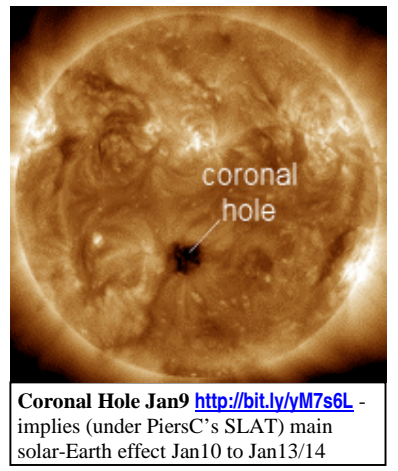

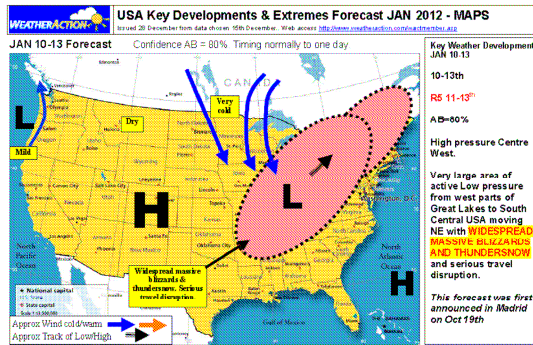

"The well placed coronal hole on Jan 9th (pic right) suggests, under our Solar Nuclear Action Technique, major Earth effects from ~10th for a few days. The massive M7.3 quake event on 10th 18:37 UTC off Sumatra, Indian Ocean (<http://bit.ly/Aflamf> & <http://on.doi.gov/yg1E9L>) supports that view. This puts our 'R5' 11-13th weather extreme and major Quake-Volcano (trial) period probably coming 10-13th, a day early, as did our previous period (R4) right, <http://bit.ly/xLiVTM>", said Piers Corbyn astrophysicist of WeatherAction.com.

TV & Met O forecasts underestimating winds ~10-13th. - See also Report2 later

"We warned that standard meteorology would underestimate our specific stormy weather type of events forecast for USA and UK ~10-13th (espec 11-13) and that is now apparent with TV forecasts 1 & 2 days ahead changing towards our long range forecasts (12 weeks ahead for USA).

Our NE USA 10-13th (esp 11-13th) snowstorm event is confirmed in timing & region: WeatherAction 2 week ahead forecast, and Accuweather 2 day ahead, below. Although it may end up less snowy than we expected we must wait for full results in Report2.

Our UK 'torpedo' low 10-13th (esp 11-13th), forecast note below is being confirmed in timing and general track with standard Met increasing winds and putting the track further South forecast by forecast (eg sub-low newly placed OVER Scotland for 11th 18:00 below). It will probably not track as far south as we first expected ~4 weeks ahead but details of further changes in standard short range forecasts should be closely watched and we will report further.

Coronal Hole Jan9 <http://bit.ly/YM7s6L> - implies (under PiersC's SLAT) main solar-Earth effect Jan10 to Jan13/14

Storms confirm WeatherAction

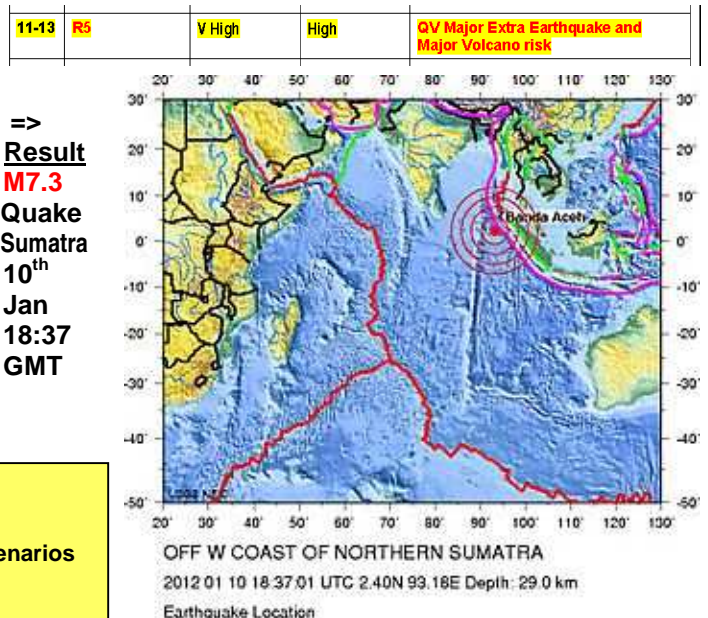

Short range TV forecasts miss most destructive winds
 "Solar coronal action beat standard Met both sides of N Sea"
 It's really right, Jan 7th and already since New Year's Eve the British Isles and NW Europe have been hit by three variable storms, and N.E. USA has been hit by another "blowing snow squalls"
 "How is that?" you ask, and "Honest?" Piers Corbyn replies "It's probably weird as the USA and UK had had a record low pressure of 982.0 mb on the 10th and 11th respectively. The waves of British Isles - NW Europe storms were quite as far as the east 2 to 3 weeks ahead of the record 982.0 mb low.
 "What is that about?" you ask, and Piers replies "I'm not sure, but I think it's a sign of a major storm system, and I think it's a sign of a major storm system, and I think it's a sign of a major storm system."
 "It's not over yet!"
 "The storm is still moving from the west coast of the USA towards the Great Lakes region, and I think it's a sign of a major storm system, and I think it's a sign of a major storm system."
 "What's behind the stormy weather so far this winter?"
 "The storm is still moving from the west coast of the USA towards the Great Lakes region, and I think it's a sign of a major storm system, and I think it's a sign of a major storm system."
 "Where next for this winter?"
 "The storm is still moving from the west coast of the USA towards the Great Lakes region, and I think it's a sign of a major storm system, and I think it's a sign of a major storm system."
