

“The damage from this storm – which we predicted to within a day 6 weeks ahead - will be on a par with the Great Storm of Oct 15/16th 1987”

- says Piers Corbyn astrophysicist and chief forecaster WeatherAction Long range Weather and Climate forecasters, 26 Oct 2013. Forecast issued 17 Sept, Right
- Piers advises this along with further special information including possible modifications needed to the MetOffice storm track forecast in a special note to WeatherAction subscribers to WeatherAction Britain+Ireland And Euro forecast services – **only available to subscribers.**

29-31 October 2013 C = 65%	
Ferocious rain, thunder and winds attack S/W parts and head east, bringing heavy rain, hail, thunderstorms and tornados likely, firstly in S/W parts and then in east and north. Thick cloud. Very mild nights, days also mild (less so in SW).	
Winds: SE'ly becoming strong/sev gale or storm in SW	
Temps: Typo see above & graph: warm / mild	
Sky: Increasing cloud	
Solar factors: R5 27-30 (timing uncertain)	
Likely possible weather map scenario: An unusual development. An active Atlantic low attacks Britain and Ireland from the south-west pushing high pressure over	

WeatherAction LR Forecast map left and what is happening (MetO short range forecast) right. Note map orientations differ.

“Everyone in Ireland, Wales and most of England is under potential threat – especially South/West parts, and should stay indoors in the danger times and take precautions to secure objects and property and not park cars under trees”.
