Weather Warning Commentary & MAP, update 25.03.13

Europe, Britain+Ireland EASTER BREAK Frid March 29 to Mon April 1st

- Further to update issued 20Mar which repeated WeatherAction warning of 25Feb (based on forecast maps of 15Feb) for THE WORST EASTER BREAK FOR DECADES in Britain+Ireland and North Europe
- NOTE media are expected to acknowledge the origin of the warning the that this will be:
- **"THE WORST EASTER BREAK FOR DECADES - according to WeatherAction long range forecasters who first made this prediction at least 4 weeks ahead"**

INFORMATION NOTE WeatherAction forecast update to subscribers issued 20 Mar stated:

We have witnessed a dramatic shift of the Jet Stream southward – firstly as our Long range forecasts implied and then further than expected. This represents a general shift of the NH (at least NW Atlantic – Europe) Jet stream to lower latitudes and spelt out:

=> **21-25 March [Public].** The low pressures will continue notably further south than in the long range forecast giving cyclonic / cyclonic East (esp in N) conditions over B+I with cold and sometimes snowy conditions continuing.

=> **26 March to April 1st inc Easter break.** [to Subscribers] The deep active 'dartboard' type lows are still expected especially in the R4 periods 26-29 and 30-31 but they will track further south so the snow content in them will increase and reach blizzard levels in North parts and rain / wintry conditions already forecast for central parts will turn to snow especially in the second half of the Easter break – 31st to 1st. Our warning of **The Worst Easter break for decades** (based on forecast maps issued 15th Feb) stands - even more dramatically.

This suggests the plunge to MIA (Mini-Ice-Age) conditions which WeatherAction predicted from years ahead are now accelerating – hence our WeatherAction pdf "The new mini Ice Age is upon us" (Ides of March). Active pdf <http://bit.ly/YwPTBH>

The new Mini Ice Age is upon us!
"MIA fingerprint now overwhelming" - astrophysicist

March 10th 1947th was the day of the thaw ending the late snowy cold winter of 1947 in Britain & Europe and there was a small sunspot proxy at the centre of the solar disc. This year, three magnetic (23yr) solar cycles later, solar activity has been generally very low and this day marked deep cold – heralding more snow: on 12th, when snow-blizzards hit S E England (Pc. Folkstone) as WeatherAction forecasted in detail 25days ahead (see map).
 "This is further evidence of the inevitable plunge – from now – into the new Mini Ice Age – one started of some years ago", said Piers Corbyn, astrophysicist of WeatherAction.com, March 10th.
 "The CO2 story is over. It has been pointing the world in the wrong direction for too long. The serious implications of the developing MIA to agriculture and the world economy through the next 25 to 35 years must be addressed."
 ** Piers' birthday!
 • The CO2 story is over
 • World cooling is now 'locked-in'
 • Average solar activity way down
 • Jet stream often way south
 • Jet Stream develops wild waves giving very extreme weather events – hail, thunder, floods etc.

 EASTER inc Mon April 1 Forecast is FREE NOW – included with March 30d forecast – when you subscribe to B+I 15-45d forecasts. APRIL 45d comes on 15 March. Subscribe: <http://www.weatheraction.com/wactmember5.asp>

WeatherAction TV – 3 NEW Vids <http://bit.ly/R4b037> - Winter 2012-13: Blizzards & Storms: Challenge to CO2 warmists: Why CO2 fails "It's the rain, not CO2!" Piers Corbyn's 'game changing' presentation June 6 2012 at 'The Greenest Event' Johannesburg South Africa <http://bit.ly/00P60RiX>

WeatherAction EXTRA COMMENT & MAP issued Mon 25 Mar, am

• Key points announced in interview with Piers Corbyn on LBC radio ~7.55am
Note map is for subscribers and not for media /web circulation except by specific agreement)

"We confirm our warning that this (29 Mar-1Apr) will be (85% confidence) the **worst Easter Break for decades in Britain, Ireland and NW Europe** in terms of travel disruption and general discomfort.

Strong biting wintry winds, snow and blizzards are expected to blast across most of the UK and Ireland in two waves during the 4 day Easter Break with heavy rain or sleet in South and West parts at times.

The snow depths which could be 6 inches to a foot with drifting of feet in places will be about double the estimates of standard TV forecasts from a day or so ahead.

Brighter, less windy, but still cold weather is likely later on Mon 1 April.

Most of Scotland will probably be brighter with less snow than other parts."

Map details available now to Subscribers to 30d or 45d B+I or 30d Eu or 'All' Forecasts.

• These cold snowy events are further aspects of the predicted developing Mini Ice Age due to generally declining solar activity with lunar modulation and a clear negation of the delusional 'theory' of CO2 driven man-made Global Warming of which there is no evidence for – only evidence against.
