

Key public news content of WeatherAction Forecast bulletins Jan 2014 - USA, Eu, Br+Ir. Format changes to fit

USA News:

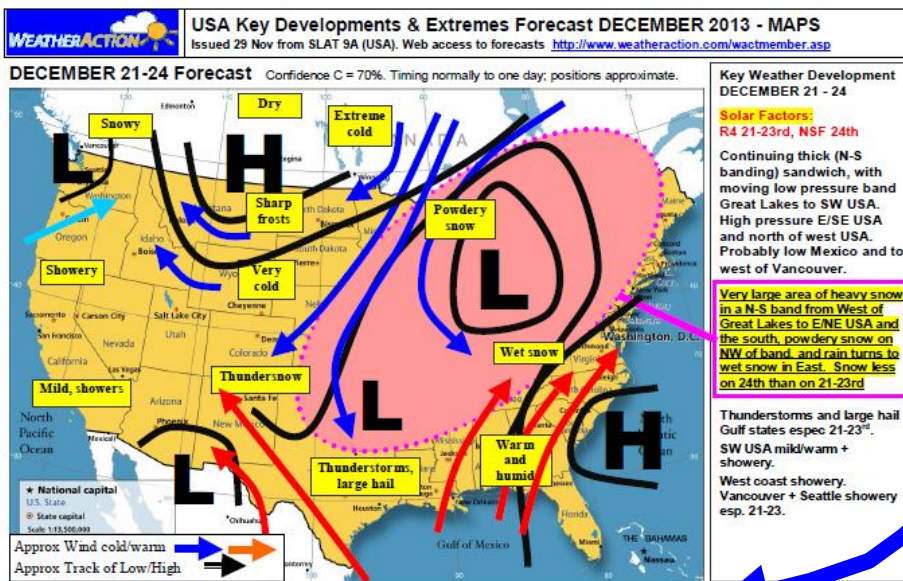

New Year Greetings to All WeatherAction USA+Canada supporters!

We've had a tremendous ground-breaking year and brilliant backing from subscribers. With your help in 2014 we will expand to further advances and longer ahead forecasts. Thank you.

"Exceedingly Awesome LR forecasts"

"Piers, me and many of my weather cohorts here in the U.S.A. follow your forecasts very closely and are most impressed with your professionalism but are particularly in awe of your accuracy regarding your long range forecasts for North America. A good friend of mine, Mr. Joseph Bastardi, has nothing but kind words to say about your forecasting...." - Jeff G from the great State of Washington.

Robert Michel Montreal and Bob Weber N Michigan gave great praise for Dec 18-20 and 21-23 forecast periods; Bob: "Exceedingly awesome USA WA R4 forecast periods Heavy precip here on 45th parallel with a short break in between. We have 6' snowbanks in our yard - it looks like the end of winter here already, not the beginning! Current "thick sandwich" WA forecast of heavy, powdery snow along with rain/wet snow over Great Lakes and southwards serving up widespread dangerous driving EXACTLY as Piers forecasted three weeks ago. "Warm and humid" in SE USA as forecasted. So where are the skeptics who say chaos theory precludes longer-range forecasting?"

Europe and Britain+Ireland News:

Beached ship, Holwerd, N Netherlands, blown ashore in the North Sea wind & sea Surge from the ('Xaver') storm that thrashed Ireland, Britain and much of NW Europe Dec 5-6th <http://bit.ly/IHljS0>

WeatherAction predicted that storm*** from 3 weeks ahead.

All significant BI-Euro storms of Dec 2013 were in WeatherAction Top Red solar factors periods and as WeatherAction explicitly warned would be the case all the Met Office's of Europe (MetEireann, UKMO, KNMI...) underestimated top winds in all of them.

Why so many storms? When will they end?

December has been unusually stormy, as predicted in WeatherAction forecast, in Brit+Ire, parts of Europe and USA (also as W-A predicted) and around the world. The reason is certain persistent solar influences and their lunar modulation - specifically a *swarm* of Top Red, **R4** and **R5**, weather action periods which have covered a much higher proportion of the month (~2/3) than normal and the very active and wild Jet stream which is also related to the greater incidence of **R4s** and **R5s** and Mini Ice Age circulation patterns now dominating the world. Only WeatherAction can predict these storm swarms and when they end. **This forecast tells you when.**

The R periods and wild behavior of the Jet Stream are driven from above and are associated with extra and extreme changes in electrical and magnetic activity above the stratosphere and in the ionosphere and the solar wind of charged particles coming from the sun and events on the sun itself**

**Note. Ideas such as 'temperature contrasts drive the Jet Stream' are totally inadequate to explain or predict events. Such a picture cannot explain the relationship between Earth weather and events in the ionosphere, magnetosphere, the solar wind and on the sun and the simultaneity of extreme storm events across earth and their ~coincidence with (radio) storms on other planets. Indeed such a low-level Earth atmosphere centred view, notwithstanding certain feedbacks, is akin to suggesting the movement of tree braches causes winds.

*** **WeatherAction pdf of ~5-6 Dec Storm**
<http://www.weatheraction.com/docs/WANews13No51.pdf>

Massive waves pound Brighton Seafront Dec 30 when as for every major storm in UK/Eire in Dec winds substantially topped MO forecasts in line with WeatherAction <http://bit.ly/1cK8PoH> [Main text above as Eu. Br+Ir was slightly shorter]

ARE YOU READY for MORE winter? You can only be as ready as your forecasts!

WHY suffer in ignorance?

ONLY WeatherAction can give you reliable long range forecasts
