24-25 April deluges England confirm WeatherAction R4 period and Brit+Ire forecast detail from 40days ahead

- RTQ (Red Weather+Tornado/thunder+Quake risk) Forecast Extract above.
- B+I Rain forecast graph extract right as in 30d & 45d forecast April 2014

Report from Carl (Subscriber) as in reader Comms <http://bit.ly/1luCdFP>
 "Torrential downpours in Bucks all day yesterday (25th). No mention at all from the countryfile forecast last Sunday (20th) and also much heavier than MetO forecast from even just 12hours out but interesting in Piers Corbyn R4 period another outstanding forecast.

I ran the computer models for next week (although unreliable) it does show pressure building over Northern latitudes. My point is!!! This is a typical Little ice age set-up that has occurred regularly since 2009.If this happened in January we would be in very serious trouble.Global warming!!! NOT WITH THAT SET-UP"

Piers says: "Thanks Carl. Real reports are very important. This April detail from 40days ahead has been going really well with this heavy Rain in parts of Br+Ir and tornadic and other events USA and Europe being well captured - better than standard Met of a few days ahead. At the same time extreme solar (driving) events and Quakes confirmed the R4 forecast detail.
