12d ahead SPECIAL UPDATE 2015
Br & Ir April 12-15 with Graph

Delta House, 175-177 Borough High St, London SE1 1HR Tel+44(0)20 7939 9946. www.weatheraction.com

A 'strong' application of the new (Solar-Lunar-Action-Technique) SLAT12 was found to be generally good in past checks so this was applied to the period 12-15th April. This gives a much more unsettled result for Br+Ir and NW Europe (inc Scandinavia) than the 45d issue.

12-15 APRIL 2015

Confidence B 75%

Special SLAT 12S update forecast produced 3/4th April, **graph inserted** later (6th)

Wet and windy, major thunderstorms and large hail, high tornado risk. Turning cloudy and very cool / cold. Possibly wintry on high ground in N/W.

Solar Factors: R4 12-15th

Thunder/Tornado risk very high

Winds: SW'ly becoming cyclonic gales in places in N/W

Temps: - turning colder than normal in all parts.

Sky: Cloudy

Developments:

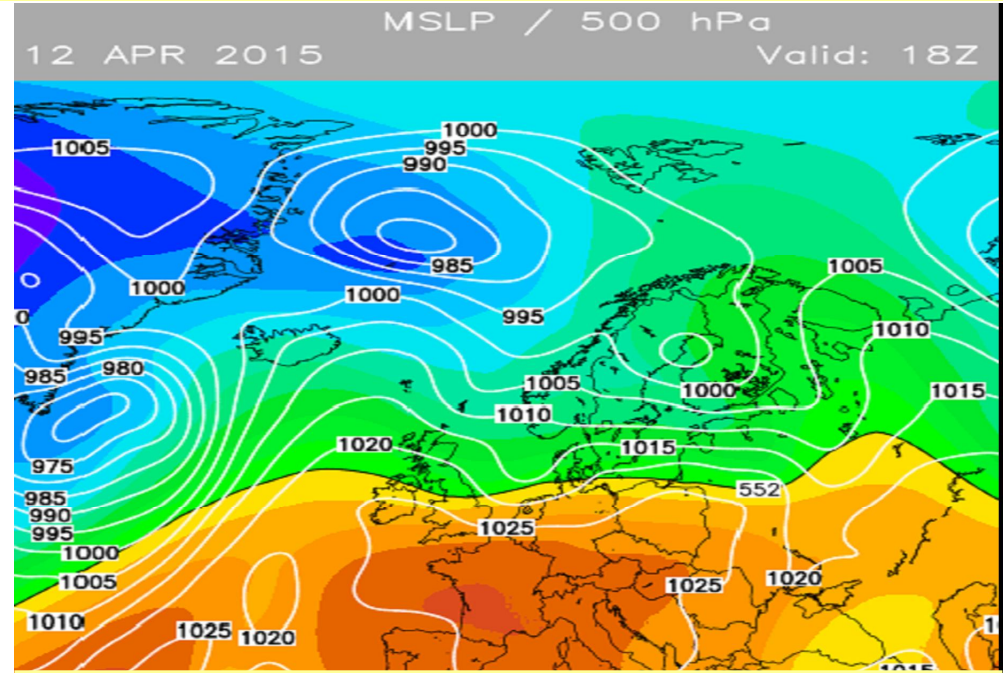

High pressure pushed East as deep active low attacks Ire + Britain and tracks through most of Britain (Cyclonic). Fronts penetrate parts of NW Europe including West Scandinavia (see Euro 30d forecasts)

Becoming wet and windy with major thunderstorms and large hail. Becoming cloudy and cold in prob all parts.

Possibly wintry snow/sleet on high ground in N/W

Piers Corbyn says: "Our important SLAT12 update for B+I & NW Europe for ~12-15 April is being confirmed. The dramatic change from dry sunny and warm over all B+I in original SLAT11 forecast to a wet and windy incursion from a Low coming from West giving wintry snow/sleet on high ground in N/W is observed.

-See P+Temp Map and Jet Stream map - cold plunge from North (lower Right).

-The initial extent to the South is maybe less /slower than the update but **the fundamental change and contrast is here.** This is important for future forecast advances and developments to many month ahead forecasts over the world.
