1. Oct-Jan World Circulation Review

Wild Jet Stream - Mini Ice Age circulation is here to stay; CO2 warmists desperate and dangerous

October to January has been a great vindication of WeatherAction warnings of Wild Jet Stream (Mini Ice Age) behavior both sides of the Atlantic and **specific confirmation in region and timing (+/-1day)** of all the main extreme (storm / major cold plunges) NH event situations predicted by WeatherAction's Solar-Lunar Action Technique (SLAT9A);

=> **The relentless series of storms in Ireland, Britain & NW Europe (since October) including 100% confirmation of WeatherAction R4 and R5 intensification of systems and down-powering in Solar Factor quieter periods.**

=> **The astounding series of 'Coldmageddons' and 'Snomageddons' N/E / Centre USA**

Piers Says "These general and specific confirmations of our weather and climate (circulation) patterns have been great. What happened in USA has been 'spot on' and the storms in Britain, Ireland and NW Europe have been superb. We would have liked some more snow in Britain at times - but that never was expected in our forecast for more than some short periods in winter so far anyway.

See <http://www.weatheraction.com/docs/WANews14No03.pdf>

"These extreme situations and therefore the importance of what might come next both sides of the Atlantic make our FEB forecasts very important - for travel, agriculture and general weather and climate forecasting science.

"The warmists are failing ignominiously and are now dangerous and desperate and make up any story they might get away with.

Dawlish, Devon, Sea wall and railway destroyed 5 Feb by storm.

2) New Important Feb Monitor-Revision Update Br+Ir+Eu

Extra ferocious storms* ~3-7 Feb (+/-1d) have implications for whole month and indicate ACCELERATING deepening or a SWITCH to more Mini-Ice-Age / Wild Jet Stream extremes Britain, Ireland, Europe, USA and worldwide.

Piers Corbyn says; "Although our R3=>R4 period ~3-7(+/-1d) Feb is on cue and more intense later in this period than earlier - in line with our forecast choices made Jan 16 - the storm tracks and pattern are somewhat further South and East than expected and more intense.

We stated in the Feb B+I forecast bulletin that the Jet Stream in Jan was even more wild than we expected and that:-

"wild contrasts along with stronger general (overall alongside regional contrasts) cooling will continue apace in more extreme form in coming months":

It appears Mini Ice Age (Wild Jet Stream behavior) intensification is happening even quicker - more like a switch than a gradual change. This means:-

1. In Feb pressure patterns especially in storm periods should be shifted South and East (or the land maps under the pressure patterns moved NW - like Kent moving to Lancashire). RELATIVE NW/ SE contrasts being preserved.
2. Wind extremes will go up typically one Beaufort notch. This has SERIOUS implications for some R5 periods where Force 10/11 becomes 11/12
3. The European patterns will be even more shifted East/SE.

MORE DETAILED UPDATE INFORMATION Br+Ir+Eu

Generally Temperature forecasts stay as they are and rainfall goes up

Br+Ir

Summary (P1) stays the same except read "Mild" bursts... instead of "Fine"...

Periods stay same. Slide maps by equivalent Kent=>Lancashire underneath words on maps to get regional effects.

Graphs stay same except Rainfall goes up one division (leaving top as 400% or more).

In terms of wet periods (i) 10-12-15th storm 10/11 now therefore goes over a wider area

(ii) 20-25th becomes a dangerous weather period over an even larger area.

Overalls: Add 60% to all rainfalls in each region; Temp & Sky Slide land map to NW under rule above

Euro

Summary (P1) stays same except add 'sometimes' before fine. Rest of p1 same.

Periods stay same.

On Word and P-maps slide land equivalent to Tunis to Algiers in that direction East to West (ie word areas W to E). and bring in wetter from West where no area is marked over sea.

Right hand bars of maps stay similar notwithstanding shifts described.

Thank you, Piers Corbyn
