## **Current & Coming Weather Commentary-Update 08-02-13 - USA Expectations for coming snow hits**

The currently (7/8<sup>th</sup>) increasing solar wind speed\* would support stronger frontal activity in the **period 8-10<sup>th</sup>** supporting the snowy prospects in NE in our Long range forecast and probably making it even more active than current short range forecasts.

\*See solar wind speed: [http://www.swpc.noaa.gov/ace/MAG\\_SWEPEM\\_24h.html](http://www.swpc.noaa.gov/ace/MAG_SWEPEM_24h.html)

This makes the period 8-10<sup>th</sup> somewhat more snowy than our Long range forecast

The implications are the short **transition period 11-12<sup>th</sup>** will be snowier than our forecast.

### **STRENGTHENED WARNING Serious, dangerous snow-blizzard and wind disruption 13-17<sup>th</sup> N/E USA**

For **13-17<sup>th</sup> (R5 13-16<sup>th</sup>)** our confidence in serious blizzards N/E USA increases and the snow / sleet rain boundary will move further South making **widespread dangerous heavy snow and blizzards likely over most of N/E USA.**

**The snow and blizzards are likely to be more severe and dangerous than whatever may come in the next few days (eg around 8<sup>th</sup>-11<sup>th</sup> ).**

**The expectation of damaging winds tornadoes and thundersnow in parts is strengthened especially for 13/14<sup>th</sup>**
